Lamina

A UNIQUE CORTICAL BONE BARRIER

Heterologous cortical collagenated bone

REGENERATION SCIENCE

INSPIRED BY NATURE

A unique biotechnology

TECNOSS®: A UNIQUE PROCESS THAT ACCELERATES AND GUIDES NATURAL BONE REGENERATION

Tecnoss® developed and patented a unique biotechnology that prevents the ceramization phase of natural bone and preserves the tissue collagen, allowing an osteoclastic-type remodelling of the biomaterial similar to physiological bone turnover and delivering a product endowed with characteristics very similar to human mineral bone⁽¹⁾.

The combination of these factors allows a consistent new bone formation and a close contact between neo-formed bone and biomaterial.

COLLAGEN: A KEY FACTOR FOR BONE REGENERATION

Collagen has a key role in bone regeneration process in that:

- a) it acts as a valid substrate for platelet activation and aggregation
- b) it serves to attract and differentiate the mesenchymal stem cells present in the bone marrow⁽²⁾
- c) it increases the proliferation rate of the osteoblasts up to 2/3 times⁽³⁾
- d) it stimulates the activation of the platelets, osteoblasts and osteoclasts in the tissue healing process

OSTEOBIOL®: UNIQUE COLLAGENATED BIOMATERIALS

Thanks to the innovative Tecnoss® technology, the OsteoBiol® line has the following important characteristics:

- 1) absence of a foreign body response⁽⁴⁾
- 2) gradual resorption over time^(5,6)
- 3) stimulation/acceleration of physiological tissue healing process⁽²⁾
- 4) protection of the grafting site from infection (membranes)⁽⁷⁾
- 5) capability of carrying medication to the surgical site⁽⁸⁾

The Tecnoss® new generation of biomaterials, thanks to a revolutionary technology, goes beyond the simple role of aiding natural bone regrowth by stimulating and accelerating this vital physiological process.

A unique cortical bone barrier

CHARACTERISTICS

OsteoBiol® Cortical Lamina is made of cortical bone of heterologous origin produced with an exclusive Tecnoss® process that avoids the ceramization of hydroxyapatite crystals, thus accelerating physiological resorption. After a process of superficial decalcification, it acquires an elastic consistency, nevertheless maintaining the typical compactness of the bone tissue from which it originates; the margins are soft in order not to cause micro traumas to the surrounding tissues.

OsteoBiol® Curved Lamina has a semi-rigid consistency and can be grafted without hydration, provided that it is previously shaped to fit the defect morphology.

HANDLING

OsteoBiol® Cortical Lamina can be shaped with sterile scissors until the desired size is reached, then it must be hydrated for 5/10 minutes in sterile physiological solution.

Once it acquires the desired plasticity, it must be adapted to the grafting site; it should always be immobilized either with titanium microscrews or sutured (Fine model) directly to the surrounding tissues with a triangular section non-traumatic needle.

OsteoBiol® Curved Lamina should not be hydrated but can also be shaped with sterile scissors, and must be fixated with osteosynthesis screws. In case of exposure, Lamina should only be removed if there is a clear suprainfection, because its consistency is such as to allow it to achieve a complete second intention healing of the wound.

CLINICAL INDICATIONS OVERVIEW

The characteristics of the OsteoBiol® Lamina are particularly useful when it is necessary to obtain a space making effect in aesthetic areas⁽⁹⁾, as well as in horizontal augmentation⁽¹⁰⁾ of two wall defects and antrostomy covering in lateral access sinus lift procedures^(11,12). Lamina can also be used for orbital floor restoration^(13,14) and is particularly indicated in association with OsteoBiol® mp3 for regeneration of ridges with compromised cortical plate.

Lamina

A UNIQUE CORTICAL BONE BARRIER

Heterologous cortical collagenated bone

Tecnoss s.r.l. is an innovative, globally active company that develops, produces and documents premium-quality xenogenic biomaterials by the brands Tecnoss® and OsteoBiol®.

Its 20 years of research led to its patent-protected production process that ensures neutralization of antigenic components in order to achieve biocompatibility, while preserving the natural collagen matrix inside the biomaterial.

Tecnoss® products comply with highest quality standards such as ISO 10993, ISO 13485 (notified body Kiwa Cermet) and 93/42/EC (notified body CE 0373).
